Quote:ipv4 network works?

Yes, otherwise I couldn't have gotten into the machine, as it is remote.

Quote:you ping gateway from VE only, or ipv6 network in HN also didn't work?

I could ping the ipv6 gateway from the HN and VE.

I couldn't get beyond the ipv6 gateway when trying to reach [www.kame.net](http://www.kame.net), from either HN or VE.

Quote:gateway on another machine?

The gateway address resides on a router upstream from the machine. The network topology is:  
server -> Cisco L2 switch -> Foundry Netiron router.

Obviously there is no issue with the switch or routers upstream of the server, since simply changing the kernel fixes the issue.

Quote:what network card used?

Broadcom

eth0: Tigon3 [partno(BCM95704A6) rev 2100 PHY(5704)] (PCIX:133MHz:64-bit)  
10/100/1000Base-T

Quote:any vlan used?

No vlan used on the server. The only vlan in use is between the router and switch.

Quote:please check `sysctl net.ipv6.conf.default.forwarding`

I verified that it was set correctly, however that setting shouldn't affect routing for eth0 on the HN, only the ipv6 connectivity for the VEs, correct?
