> This panic is FEAR FACTOR Very Happy

no one is protected from bugs :/

> I don't want to see that Message ever ever again.
> Ok if you tell me how to reproduce it I can try it for you now.

according to oops messages it's application called 'ghc-6.8.2'.
Find out the binary inside VPS using "find / -name ghc*" command.

Next, you have to understand what command line options are given to this command when it's executed.
If your user inserted it to some shutdown script try "grep -r '\<ghc' /etc" to find the caller.

So when you found what the binary is and how it's executed - it's a matter of try only you can actually clone this VPS to another machine and try there first.
