Hello,

From times to times, when a random vps is rebooted the node suddenly became unstable and we can see the following messages on the console:

```
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
unregister_netdevice: waiting for lo to become free. Usage count = 631
```

The only way to solve it seems to be rebootin the box.

It didn't happen every time the VPS's are rebooted, seems completly random. Anyone have ideas?

Kernel: 2.6.18-53.1.6.el5.028stab053.6 (oVZ stock kernel(rpm))

Thanks in advance,
