Hello,

The problem is that on centos-5-minimal udev package actually is not installed and our vzdev package provides udev capability. rpm -q --provides vzdev show us that we have only udev = 084-13. It is insufficient for us.

What can I suggest you:

1. If there is only this issue and you know additional parameter for yum to exclude udev verification you can use it.

2. Install appropriate udev package inside VE and remove vzdev package from inside the VE.  
Please look at this page after these operations!!!

[http://forum.openvz.org/index.php?t=msg&goto=26055&&srch=%2Fdev%2Fpty+always#msg\\_26055](http://forum.openvz.org/index.php?t=msg&goto=26055&&srch=%2Fdev%2Fpty+always#msg_26055)

P.S. There is an useful article [http://wiki.openvz.org/X\\_inside\\_VE](http://wiki.openvz.org/X_inside_VE)  
I hope it will help you.

Thank You!
