hm... weiß denn keiner die lösung?

unter http://wiki.openvz.org/Setting_up_an_iptables_firewall ist folgendes vermerkt:

"Setting up a firewall that allows per-container configuration

This setup configures iptables on the HN to disallow access to all hosts, including the containers. However, it allows all traffic into the containers so they may define their own iptables rules and therefore manage their own firewall.

This content is missing. You are invited to fill it in, if you get to it before I do. "

irgendjemand muss doch wissen, wie das funktioniert?
liebe grüße,
joseph
