Scott, I suppose we need to check 2 things:

1. SendFile. We need to check whether apache is using or not SendFile. I'm not a big apache guru, but AFAIK there should be SendFile option for this in httpd.conf. Can you check it please? If it uses SendFile try to switch it OFF. This will make us closer to the problem

BTW, do you use i686 installation and kernel? just in case...

2. there should be something written about this in apache log. If it fails to send data, then it should log. If it is stuck, then you can check whether there are processed in D state with ps.
We need to find what apache does and where the problem occurs.
You can also set MaxClients to 1 in apache configs, restart it and strace the only apache child.
