hi,

thanks for your reply. right no panic, oops or so. only a reboot (of course with the following of crashed mysql dbs...).

i can reproduce the problem with creating a higher load on the vps. looks like frank posted...

it's a remote server with no opportunity to attach a serial cable. sry. i reproduced it with a peppercon lara on the machine and there's really no message.

there's also no chance to go back on the stable kernel. i failed to compile the 2.6.8 on ubuntu because of the gcc version. a lot of people have the same problem and i found some patches in the internet but none work

regards and a good night.

cu tb
