hi,

thanks for your reply. right no panic, oops or so.only a reboot (of course with the following of crashed mysql dbs...).

i can reproduce the problem with greating a higher load on the vps. looks like frank posted...

it's a remote server with no opportunity to attach a serial cable.sry. i reproduced it with a peppercon lara on the machine and there's realy no message.

there's also no chance to go back on the stable kernel. i failed to compile the 2.6.8 on ubuntu because of the gcc version. a lot of people have the same problem and i found some patches in the internet but noone workt

regards and a good night.

cu tb
