Hi all,

I just observed a strange problem with nfs, seems that remount does not work anymore:

My fstab looks like:

```
aipaddr:/pve/0.9 /pve/0.9 nfs ro 0 0
```

When I try to remount that directory rw:

```
> mount -o remount,rw /pve/0.9/
```

Everything works as expected. But remounting it ro later fails:

```
> mount -o remount,ro /pve/0.9/
```

```
mount: /pve/0.9 not mounted already, or bad option
```

This failure seems to be specific to openvz kernel (2.6.24) from git.

- Dietmar
