This looks like a great piece of software, but since I'm new to VTONf, & OpenVZ for that matter, I have a few questions.

If I have a CentOS 5.0 server, running cPanel already, but with OpenVZ installed by my host, how would I use VTONf without breaking anything?

Does it automatically create the partitions for the VE's?  
Does it need LVM to work?

If I have 2 HDD's, and I want to use the second HDD for my VE's, how would I need to partition it?
