When I use a kernel with this patch, I cannot make it deadlock, which is good, but I also am unable to make the TCP window increase to anything more than 960 _bytes_, even in VE0, which is obviously very bad (limits available bandwidth in my test case by about 50%).

As the next step I'm going to build a kernel with the 028.53.3 openvz patch, but without the window fix patch, to see where the problem lies.
