Can you check (in all of your containers) that there is a script called /etc/rc.d/rc6.d/S00vzreboot (or /etc/rc6.d/S00vzreboot)? It should be there and it should create the "reboot mark" (i.e. the file /reboot inside a container).

Also note that "reboot check" is initiated every 5 minutes (from cron) so please wait long enough.

BTW do you have cron daemon running on host?
