Subject: Multiple interfaces with iptables

So I have been struggling with this topic for a few days. I have my HN that has two network interfaces. I have one for the HN that only has assess from my private network.
I have a VE running with a dedicated NIC to it that I want to filter using iptables, but everytime I start up iptables in the VE it locks everything down and I get Bad Checksum errors from tcpdump.
I turn off iptables and everything works perfectly, I can hit the web server and ssh into the VE.
I have been searching on how to get the iptables to run on the VE without NATing things though the HN with a dedicated interface but I haven't found anything.

Thank you in advance!!!
