
Subject: Exposing a virtual node as a public machine

Hi,

We have just set up our first virtual node. Now we would like to expose the virtual node to the Internet as a first-class machine. It should have its own public IP address and should not communicate with the HN in any way.

The HN is CentOS 5, it has eth0 and its public IP address let say 111.111.111.111. The virtual node should be accessible at the address let say 222.222.222.222.

I guess it's a pretty common use case but, the docs are not very clear on how to do it. Any ideas?

TIA.

Slava
