It is impossible to replicate the problem. When I reported the error, it was probably the first time the server had crashed while I was doing something. Last night for example, the system crashed after 9 days, with no notification in kern.log.

The kernel was built from vanilla sources. However, it was compiled using the debian kernel-package tools.

I have turned on /proc/sys/debug/decode_call_traces. Now is it time to wait and see what happens?
