I need that fix too
Im using Git compiled version of kernel too.
At uname -r i get this
2.6.24-core2
That I wish to name my kernel i guess must me another way to find if the kernlel is openvz
compatible or not like looking in /proc/config.gz on modern kernel version you can find the setting
for OpenVZ specific kernel.
Thanks
P.S if is a patch you can atach to this post only if his size not past 2Mb
