As I said in my first post, I was working in one of the VPS's when I got a message that my script cannot be executed because I am limited to 334MB of memory when the server node is running out of free memory. In the meantime, the VPS itself is limited to 512MB guaranteed RAM and 1024MB burstable and as you can see the main node has lots of cached RAM (free ram). Why did I get that message I am limited to 334MB?
