Vzdump, that's good to know though I'm still curious on the negatives (if any) on this approach. I know that with OpenVZ, 10s let alone 100s of VEs can literally take up little to no disk space due to how it utilizes file system hard links. I assume that the tar/cp/vzdump approach loses this efficiency. Correct? Is there any thing else that I would lose when using vzdump vs. "vzctl create"?
