Hi,

Quote:1. yum install vkernel-enterprise

1. Ok

Quote:2. Server did not boot after I modified the boot sequence

2. How did you modify boot sequence?

Quote:3. Yes I got same error of kernel panic in both the kernel.

3. I meant "No module it8213 found" error

Quote:4. Can memtest be run from ssh or I have to make bootable iso?

http://wiki.openvz.org/Hardware_testing

Quote: Usage

To test your system for faulty RAM, install either memtest and reboot into it. Run it for at least a few hours (at least 2-3 iterations). If there will be even a single error reported, you have to change your RAM chips (or, if your system is overclocked, downclock it to normal speed).

Quote:This is second time I got kernel panic. I got this panic 2 months before also and I was told it's listed in bugzilla.

You'd better provide developers with more information in bugzilla ticket if you've faced with this problem another time. Please do it!!!
