Subject: Re: Kernel Panic OpenVZ install failed No module it8213
Posted by whatever on Mon, 21 Apr 2008 14:24:16 GMT

We rebooted the server with PAE and I don't know how come server is booted to PAE kernel this time.
STRANGE!!!!!
I can see 8gig RAM in server. So I believe now memtest is not needed.
I will post in bugzilla this error.

How can I show you kernel panic? I believe I have taken screenshot all the time it caused error. What is the specific info you looking for let me know.

Let me know if you want me to post some info as server is up now maybe that could help you guys to find a fix for it.

Thanks

maratrus wrote on Mon, 21 April 2008 10:11Hi,

1. Please try to pass memtest86+. It might be important.
2. If you have the same situation like it was 2 month ago, you should fill your bugzilla ticket it also might be very helpful.
3. Try to show us the full kernel panic message. I think that pictures are not sufficient. Some information are still beyond us.
4. To be more honest you can compile your own kernel (RHEL5 based) with PATA_IT8213 module enable.
