Ok I've got the sysfs relevant patches ported to 2.6.25, and am looking at how to extend it to handle /sys/kernel/uids. You have tagging tied intimately to struct class. So the question is should I generalize the taggant to deal with kobjects instead, or create a struct class user and make /sys/kernel/uids a symlink to /sys/class/user/uids?

Opinions?

thanks,  
-serge

PS: If you want me to post the patchset before handling userns I can do that, otherwise I was just going to wait until I'm done with userns.
