Hello,

Please tell us the exact kernel you use, version of vzctl, what ostemplate do you use and where have you got it?

1. `uname -a`
2. `vzctl --version`
3. What OS template, where have you got it?

P.S. And also please try to drop VE's quota

- `vzctl stop 960 (vzctl umount 960)`
- `vzquota off 960`
- `vzquota drop 960`

Thank You!
