Look at this top output:

```
[root@localhost ~]# ps aux |grep vzctl
```

```
root  20642  0.0  0.0  1832  624 ?        D   May01   0:00 vzctl stop 188
root  27285  0.0  0.0  1828  648 pts/2    D+  08:05   0:00 vzctl stop 055
root  28732  0.0  0.0  1868  144 ?        D   May01   0:00 vzctl: pts/0
root  29278  0.0  0.0  1828  648 pts/4    D+  May01   0:00 /usr/sbin/vzctl set 106 --cpuunits
2000 --cpulimit 0
```

I noticed by customer that some web was offline. I connected to hardware node of VE by ssh. So I tried a normally stop and start action with vzctl command. Nothing happened. Is very strange. Vzctl command change to a D+ state, uninterruptible sleep

I didn't notice any error message in any log system...Anyone has some idea of that? Well, yes, I read some errors in failcnt of VEs. Nothing important I think. All worked well until yesterday.

Thanks.
