Subject: Could not compile a package agains the ovz kernel!?
Posted by zenny on Tue, 06 May 2008 11:58:52 GMT

I am trying to rpmbuild zaptel and other asterisk-related files against the
ovzkernel-2.6.18-53.1.13.el5.028stab053.10. I installed ovzkernel-devel too.

Still while I try to build do a
#rpmbuild /usr/src/redhat/SPECS/zaptel.spec

I keep on getting an error message:

rpmbuild -bb zaptel.spec
error: Failed build dependencies:
 kernel-devel = 2.6.18-53.1.13.el5.028stab053.10 is needed by zaptel-1.4.9.2.xpp.r5517-3.i386

zaptel.spec is attached for your perusal.

How can I compile this package from SRPMS against ovz-kernel specified above in centos5.1
VE? Any pointers? Thanks in advance!
