---

We've successfully installed openvz on centos 4.6 and it works great. We're now trying to attach the hp fiber card to a EMC SAN system. We are having problems installing the fiber card driver. When I execute the install script I get:

```
Emulex LPFC Driver Installer Version 3032
```

```
Determining distribution type and kernel version ...
```

```
Checking for Emulex LPFCDFC driver packages ...
```

```
Checking for old Emulex driver ...
```

```
Looking for kernel development package ...
```

```
Looking for compilers ...
```

RPM cannot be installed: ovzkernel-smp-devel-2.6.9-023stab046.2 package is required.

Is there a devel kernel package available?

Thanks for you help

steven
