I am following the wiki page

http://wiki.openvz.org/Setting_up_an_iptables_firewall

When i get to the script to set up the HN-based firewall i am always getting this error when i start the firewall service

```
Firewall: Purging and allowing all traffic          [ OK ]
```

```
Firewall: Setting default policies to DROP          [ OK ]
```

```
Firewall: Allowing access to HN
```

```
port 53iptables v1.3.5: Unknown arg '--destination-ports'
```

```
Try `iptables -h' or 'iptables --help' for more information.
```

```
/etc/init.d/firewall: line 46: 53: command not found
```

```
iptables v1.3.5: Unknown arg '--destination-ports'
```

```
Try `iptables -h' or 'iptables --help' for more information.
```

```
/etc/init.d/firewall: line 48: 53: command not found
```

I have installed a fresh VZ host node on a fresh centos 5.1 base server installation. All my installation was done via yum using the wiki as a guide.

Anyone else found this problem?
