From vzctl man

Quote:Device access management

--devnodes device:r|w|rw|none

Give the VE an access (r - read, w - write, rw - read write, none - no access) to a device designated by the special file /dev/device. Device file is created in VE by vzctl.

--devices b|c:major:minor|all:[r|w|rw|none]

Give the VE an access to a block or character device designated by its major and minor numbers. Device file have to be created manually.
