Well, I am using linux-2.6.18.tar.bz2 and patch-ovz028stab053.4-combined.gz.

So the steps I use to build the kernel are:

1. untar kernel, cd linux-2.6.18, apply ovz patch
2. copy config-2.6.18-028stab053 .config; make oldconfig
- 3 build the kernel and install. I generally use the debian way:

fakeroot make-kpkg --revision=ovz.02 --initrd --config menuconfig binary-arch modules_image

to produce a .deb, but running make && make install should do the same.
