Subject: fuse kernel module Posted by ritesh sinha on Fri, 30 May 2008 11:34:05 GMT View Forum Message <> Reply to Message

Hi all,

I was trying out openvz and ended up in trouble.

I was trying install glusterfs on a centos VM (over centos base machine). For this i needed to install a kernel module called fuse.

I compiled it & installed it. The kernel module file fuse.ko gets created, but when i try to do "modprobe fuse" I get: FATAL: Error inserting fuse (/lib/modules/2.6.18-53.1.19.el5.028stab053.14/kernel/fs/fuse/fuse.ko): Operation not permitted

There is no permission related issue (i am working as root). The bad thing is that when i do Ismod on any VM the output is null (I see no kernel modules at all). This prompted me on thinking that whether modprobing any kernel module is allowed or not. ?

Kindly help me sort this problem

Regards Ritesh
