Thanks to maratrus, I have found the solution ! It was indeed related to git, and not to OpenVZ.

Debian uses runit (<http://smarden.org/runit/>) to run git-daemon, and creates a default run file:

```
git:~# cat /etc/sv/git-daemon/run
#!/bin/sh
exec 2>&1
echo 'git-daemon starting.'
exec chpst -m64000000 \
  git-daemon --verbose --base-path=/var/cache /var/cache/git
```

There is indeed a hardcoded (stupid) limitation. Removing it solved the problem.

Pierre
