Could you explain the benefits of this even when we have memrlimit controller ?
(If unsure, see 2.6.26-rc5-mm1 and search memrlimit controller.)

And this kind of virtual-address-handling things should be implemented on
memrlimit controller (means not on memory-resource-controller.).
It seems this patch doesn't need to handle page_group.

Considering hierarchy, putting several kinds of features on one controller is
not good, I think. Balbir, how do you think ?

Thanks,
-Kame
