In a perfect world, you'd have a network or serial console

(http://wiki.openvz.org/Remote_console_setup). But in reality,
it would be good if you at least show us the IP (RIP for x86_64)
value - it is usually printed one of the last.

And, since you compiled the kernel yourself, get prepared to
disassemble your vmlinux/modules (with objdump utility).

Anyway - fill in a BUG.
