I don't quite understand the question. I assume you're asking whether your cgroup, when composed with ns, will refuse a task in cgroup /cg/1/2 from being able to

mkdir /cg/1/2/3 echo \$\$ > /cg/1/2/3/tasks

or

unshare(CLONE_NEWNS)

which the ns cgroup would allow, and what your cgroup would do in that case. If your question ("not-allowed ?") is about ns cgroup behavior then please rephrase.

thanks, -serge
