```

Yes, right now I'm fighting something which looks like double free of conntrack during clone(CLONE\_NEWNET)/exit test despite none created in netns. And unknown to me dimensions of input and output packet codepaths. :^)

Preliminaty details:

struct nf\_conn::ct\_net which pins netns netns of expectation is netns of master countrack by definition per-netns countrack hash

## per-netns expect hash per-netns unconfirmed list
