| > dup2() to get back the correct fd, so maybe I'm missing something...
|
| Yes, I agree.
|
| Though I wonder if it's possible that the two fds returned could be

```

| swapped during restart. Does anyone know if POSIX makes any guarantees
| about the numeric relationship between pipefds[0] and pipefds[1] (like
| "pipefds[0] < pipefds[1]")? If there are no guarantees then it may be
| possible for a simple dup2() to break the new pipe. Suppose, for
| example, that the original pipe used fds 4 and 5 in elements 0 and 1 of
| the fd array respectively and then we restart:

Yes, I was just thinking about this assumption and was wondering if
I could find the peer fd by walking the list of fds in /proc/pid/fd
and doing an lstat() and comparing the inode numbers.

Then save the peer fd in fdinfo. On restore, we could create the
pipe and dup2() both read and write-side fds.

```
|  
| t_d(PT_PIPE(pid, pipefds)); /* returns 5 and 4 in elements 0 and 1 */  
| if (pipefds[0] != fdinfo->fdnum)  
| PT_DUP2(pid, pipefds[0], fdinfo->fdnum); /* accidentally closes  
| pipefds[1] */
```

| I don't see anything in the pipe man page, at least, that suggests we
| can safely assume pipefds[0] < pipefds[1].

| The solution could be to use "trampoline" fds. Suppose last_fd is the
| largest fd that exists in the final checkpointed/restarting application.
| We could do (Skipping the PT_FUNC "notation" for clarity):

```
|  
| pipe(pipefds); /* returns 5 and 4 in elements 0 and 1 */  
| /* use fds after last_fd as trampolines for fds we want to create */  
| dup2(pipefds[0], last_fd + 1);  
| dup2(pipefds[1], last_fd + 2);  
| close(pipefds[0]);  
| close(pipefds[1]);  
| dup2(last_fd + 1, <orig pipefd[0]>);  
| dup2(last_fd + 2, <orig pipefd[1]>);  
| close(last_fd + 1);  
| close(last_fd + 2);
```

| Which is alot more code but should work no matter which fds we get back
| from pipe(). Of course this assumes the checkpointed application hasn't
| used all of its fds. :(

This sounds like a good idea too, but we could use any fd that has not yet been used in the restart-process right ? It would break if all fds are used AND one of the pipe fds is the very last one :-)

In that case, we could maybe create all pipe fds first and then go back to creating the rest ?
