```

I think that if we're going to do this it would be nice to add a symmetrical `cgroup_unlock_live_group()`?

Because code like this:

```

> + if (!cgroup_lock_live_group(cgrp))
> +  return -ENODEV;
> + strcpy(cgrp->root->release_agent_path, buffer);
> + mutex_unlock(&cgroup_mutex);

```

is a bit WTFish, no? it forces each caller of `cgroup_lock_live_group()` to know about `cgroup_lock_live_group()` internals.

That would be kind of OKayish if this code was closely localised, but...

```

```

I assume this gets used in another .c file in a later patch.
