You can have different distros in different VPSs, including RHEL 4.

I am not sure what do you mean by "on this VPS". If you mean "on this server", the answer is they will stay as is.

Still, from the security standpoint, after you have installed OpenVZ, you should move all the services/daemons (other than sshd and some needed stuff like syslogd and crond) running on the machine into a VPS or a few. Otherwise you could have problems.

The Linux you have on your server will pretty much stay as-is. If you want to create VPSs you need more IP addresses for them.

I am not sure how it could be done even more simple than described...

Perhaps an installer script; but the installation is what you do just once and it's probably better to do it manually in this case, just to get sense what is happening when you install OpenVZ.

I suggest if you find it too cumbersome you should hire some system administrator to do that for you, or ask for fee-based installation and support from OpenVZ; ask for it to sales@openvz.org

PS Looks like you haven't read the documentation at all, going the easy way of asking before reading -- please do read the docs first. This is open source project not a commercial entity so free support and the

answers are provided on a 'best-effort' basis and we can not answer each and every question which is already answered in docs.

Well, of course we (well, not we, but OpenVZ support team) can, if you buy OpenVZ support. Please do not see it as I am trying to sell something -- I do not; I just try to let you know how are things are done here, what are the possible ways and options.

Regards,
Kir.
