No answers? Its been a while...

We have a bunch of openvz VMs, nothing 'in production'. The host has 4G of RAM. I want all the VMs to have access to 4G of RAM and all the sockets and other stuff that they may need at any time; I don't have time to carefully tune the parameters of all of them to just what they need and no more.

I don't mind or care that they are over-committed I just want them to have max resources.

Thanks
