Hello!

I have several servers with openvz (adminstrated through HyperVM) and sometimes on few of them I can see two init processes where one of them consumes 100% of cpu. What is the possible reason for that?

When I kill this process it does help but probably after some time problem occurs again. Below I show how it looked from top command:

```
PID USER   PR NI VIRT RES SHR S %CPU %MEM  TIME+  COMMAND
8816 root   25  0 1756 680 592 R 100  0.0  1529:49 init
```

Thank you for any help.
