Subject: problem booting...

Hi,

I've installed openvz several times with no problems (usually with CentOS 4 as the base system)

However on a new remote install I'm having problems.

The base system is (real) Red Hat Enterprise Linux ES release 4 (Nahant Update 1)

The system boots into the kernel but then I cannot connect. I can ping the system but no ssh connection. If I boot back to the regular kernal I can ssh in.

The only messages on the screen are:

"Init spawning too fast"

and

"Watchdog, No such file or directory"

Any ideas of what might be wrong?

Thanks!
