Hi,

1.
recalculating disk usage - may be a very long process.
May be it worth waiting.
If this process doesn't wake up you can get the call trace of vzctl process via Alt-SysRq-T command but it shows a lot of information so there is a chance that syslog won't save appropriate information in /var/log/messages. If you want you can set serial console.

2.
More radical way is killing vzctl process.
I don't know if it helps. But you can try.
Try to off and drop quota after killing vzctl (vzquota off 380 (or vzquota off 380 -f), vzquota drop 380). Then try to start again.

by the way could you please estimate disk space of that VE. Is it huge?
