Subject: Any tool to monitor the intercommunication between VPS and HN?

Hi,

I am a beginner of OpenVZ. My situation is that:

I have set up 2 VPS(101 and 102) on a HN.

And I have successfully run X applications inside the VPS 101.

My problem is: I start the application FireFox in 101. The browser shows up on the HN's screen. I enter the URL and the browser returns the web page of given URL.

Now, how can I trace the interaction between the VPS and HN? I want to know how my input URL is delivered to the VPS and how the web page is returned.

Is there any tool to do this?

Thanks a lot!
