
Subject: openvz patched vanilla kernel vs redhat kernel

Hi,

This is question to the developers:

I'm wondering if there are any pros and cons
in running vanilla kernel with openvz patch vs
redhat kernel with openvz patch?

Currently i have some gentoo boxes with kernel RHEL5 028stab057.2
which with minimal test seems to be working fine.

Other gentoo boxes are running kernel 2.6.18 028stab053.14

So i'm wondering if it is worth switching to RHEL5 kernel?

Thanks

Alex
