privvmpages 4052 49146 49152 53575 2020 in last column means, that 20 times privvmpages barrier/limit was hit. Thus 49152/53575 pages aren't enough for your situation.

Just increase this limit:

vzctl set 1 --privvmpages 100000 --saveAnd retry to start apache. After that check /proc/user_beancounters to be sure, that 100000 pages are enough.

Good luck.
