Hi,

Quote:

If I do that without assigning an IPv4 address to veth, only the IPv6 address is received on the network

why do you think that? IP address on veth interface doesn't make any sence.

You have appropriate ip address on eth interface inside your VE and this should be sufficient.

Packets from VE follow to eth0 interface inside VE.

Packets to VE follow to veth interface inside HN. (see "192.168.10.28 dev veth1028.0 scope link").
