Hi maratrus

VE's were created with vzctl command, migration was not done with the utilities though.

I meant I hoped that a 32-bit VE could be used in a 64-bit HN with 32-bit.

I think you are correct that 32-bit utilities on a 64-bit HN are not really compatible.

Might it be possible in the future for more compatibility?

At least now I know why the strange behaviour and errors happened.
