I am trying to set a VPS I created to have the following specs:

1 Ghz Guaranteed CPU (Burstable Up-to 2 Ghz)
512 MB Guaranteed RAM (No bursting)

Also, is there a way to limit the maximum upload/download speed per VE? E.g. VE xxx can only upload at 256 kb/s and download at 512 kb/s or is this impossible to do? I saw some settings about TCP buffer size, but I didn't quite understand.

P.S. I am not trying to just workout how to set the above, I am trying to learn, so a few extra details on why you set it like that etc would be most appreciated.
