finist wrote on Tue, 09 September 2008 02:29Hi,

Quote:you see, if "buffers" and "cached" is unavailable, it actually needs more memory for running applications, right?

This should not influence at all in fact.

Please, check /proc/user_beancounters - is there any failcounters after an attempt to start tomcat/mysql?

Konstantin

Yes, there are failcounters. Starting tomcat is OK, it just happens when I try to shutdown tomcat. 384MB is not enough for tomcat and mysql in a VE, while it is enough in a physical machine(no swap)?
