Hi.

http://wiki.openvz.org/Traffic_shaping_with_tc
i think this is the answer for your question about traffic shaping.
Please, keep in mind that it makes sense to shape only outgoing shaping as what would you do
with network packets already received but more than configured limit? Drop? Inefficient.

Quote:$ vzcfgvalidate /etc/vz/conf/VEID.conf
and it replies like this ...
Error: limit should be = 9223372036854775807 for vmguarpages (currently, 131072)

Well, seems to understand this one needs to check the sources of the vzcfgvalidate. You are
welcome to find out the problem. i don't think this is difficult - just need to find the corresponding
printf() and check what formula is used to get the printed value.

Good luck!
