---

An application inside the VE is not working properly, so I decided to check the beancounters and this is what I saw:

<http://i33.tinypic.com/210kgpj.png>

My current setting is based on the "vps.basic" configuration file, so this is what I have for TCP send/recv buffer size:

```
TCPSNDBUF="1720320:2703360"
```

```
TCPRCVBUF="1720320:2703360"
```

Since I have about 8 fail count in the short time I was using my VE, should I increase this limit or ignore it because this is normal?

Btw, are these limit in kilobytes or bytes or some other units?
